

# **Aspects of Geography in European higher education: Using computers in learning and teaching**

Edited by: Karl Donert

Karl Donert is coordinator of the HERODOT thematic network for Geography in higher education in Europe, International Research Fellow and Director of Development at Liverpool Hope University College

*Aspects of Geography in European higher education: Using computers in learning and teaching* has its origins from a meeting of European Geography teaching organisations held as part of the EUROGEO Conference held at Liverpool Hope University College in September 2001. It has been created by European colleagues who attended the HERODOT Brno seminar and professional development workshop programme in mid-October 2005. It is third of a series of publications produced by the HERODOT Thematic Network, published by Liverpool Hope University and its development was supported by the European Commission, Socrates Action and the University of Brno.

*Using computers in learning and teaching* develops aspects of the Bologna Process and follows from the TUNING survey undertaken as part of the project goals and objectives. It examines the state of the art in different universities and teacher education departments across Europe.

HERODOT is supported by the European Commission Socrates Action for Thematic Networks in higher education. This publication has been made possible through grants made available to the HERODOT network.
