

Aspects of Geography in European higher education: Geographical Information Systems

Edited by: Karl Donert

Karl Donert is coordinator of the HERODOT thematic network for Geography in higher education in Europe, International Research Fellow and Senior Lecturer at Liverpool Hope University College

Aspects of Geography in European higher education: Geographical Information Systems has its origins from a meeting of European Geography teaching organisations held as part of the EUROGEO Conference held at Liverpool Hope University College in September 2001. It has been created by European colleagues who attended the HERODOT Malta GIS seminar and professional development programme in mid-November 2004. It is produced by the HERODOT Thematic Network, published by Liverpool Hope University College and is sponsored by the European Commission, Socrates Action and its developments were supported by ESRI and the Geography Department at the University of Malta.

Higher Education GIS in Geography: a European viewpoint develops aspects of the Bologna Process and follows from the TUNING survey undertaken as part of the project goals and objectives.

HERODOT is supported by the European Commission Socrates Action for Thematic Networks in higher education. This publication has been made possible through grants made available to the HERODOT network.
